Where can I find a detailed example of pushover analysis?

Example of a building analysis Presented in this section are the results of a pushover analysis done on a 10 storey RC building of a shopping complex (Jisha, 2008) (Fig.8) using the structural package of SAP2000. In the model, beams and columns were modelled using frame elements, into which the hinges were inserted.

The Pushover Analysis, explained in its Simplicity

The mean spectra in Fig. 6 (b) are used for the pushover analyses. The displacement demands from the push-over analysis are compared with the mean values of the maximum displacements from dynamic analysis. The period T_s for the 5% spectrum is 0.4 seconds. This is between the 0.3 and 0.45 second periods of the example structures B1 and B2.

The most common analysis sequence is: Apply gravity loads. Run one or more static push-over analyses, with constant gravity load. Run one or more earthquake response history analyses, with constant gravity load. This is a "standard" sequence. A "general" sequence can also be applied, for example cyclic push-over as follows: Apply gravity loads.
