Most of the hot air flows out of the back end of the computer case. There should be at least 2-3 inches open on either side and the back should be completely open and unobstructed. If your computer is hidden away inside a desk, make sure the door isn't closed all the time. Cool air enters from the front and sometimes from the sides of the case.

### 11 Best Ways to Keep Your Computer Cool - Lifewire

if you can't stand the heat, get out of the kitchen If the pressure or stress is too great, leave or give up. For example, It'll take a lot of weekend overtime to finish, so if you can't stand the heat, get out of the kitchen. This folksy adage has been ascribed to President Harry S. Truman, who certainly said it and may have originated it.

**If you can't stand the heat, get out of the kitchen ...**

Even if it doesn't give out, over-inflation can cause a tire to prematurely wear and interfere with braking. There are three things at play when the heat causes air pressure to build: Hot Molecules All materials are made up of atoms and molecules. When molecules get hot they start to vibrate intensely. The vibration causes expansion.
