To achieve maximum lettable floor space the design should balance the number of floors against floor-to-floor height, paying attention to the intended building use. The target floor to floor height is based on a floor to ceiling height of 2.5 m to 2.7 m for speculative offices, or 3 m for more prestige applications, plus the floor depth including services.

The first types of insulated floor systems incorporated T-shaped polystyrene infill blocks that sat in between the prestressed concrete T-beams and the tops of the infill blocks sat above the beams. Where necessary thin sheet material was cut to cover the top of the beams, allowing for different widths and multiples of beams (see Figure 1).

NOTE: NO FURTHER DISCOUNT FOR THIS PRINT PRODUCT--OVERSTOCK SALE -- Significantly reduced list price. Content published in June 2006. It presents seismic design and construction guidance for one- and two-family light frame residential structures that can be utilized by homebuilders, homeowners, and other non-engineers, and provides supplemental information to the 2003 edition of the International Residential Code. Includes background information on the principles of seismic resistance and how earthquake forces impact conventional residential construction and more detailed information on architectural considerations. Discussions of masonry and stone elements, examples of typical floor plans for earthquake resistant one- and two-story homes, excerpts of seismic requirements from building codes, and checklists for home builders are included. The guide also presents a series of "above code recommendations" and low cost measures that would increase the performance of the building and help keep it functional after an earthquake. Homeowners, homebuilders, home construction crews, home construction contractors, home designers, home architects, structural engineers, and others involved in the structure of building a home may be interested in this book guidance. from FEMA. Concrete is a global material that underwrites commercial wellbeing and social development. There is no substitute that can be used on the same engineering scale and its sustainability, exploitation and further development are imperatives to creating and maintaining a healthy economy and environment worldwide. The pressure for change and improvement of performance is relentless and necessary. Concrete must keep evolving to satisfy the increasing demands of all its users.

This comprehensive code comprises all building, plumbing, mechanical, fuel gas and electrical requirements for one- and two-family dwellings and townhouses up to three stories. The IRC contains many important changes such as: An updated seismic map reflects the most conservative Seismic Design Category (SDC) based on any soil type and a new map reflects less conservative SDCs when Site Class A, B or D is applicable. The townhouse separation provisions now include options for using two separate fire-resistant-rated walls or a common wall. An emergency escape and rescue opening is no longer required in basement sleeping rooms where the dwelling has an automatic fire sprinkler system and the basement has a second means of egress or an emergency escape opening. The exemption for interconnection of smoke alarms in existing areas has been deleted. New girder/header tables have been revised to incorporate the use of #2 Southern Pine in lieu of #1 Southern Pine. New tables address alternative wood stud heights and the required number of full height studs in high wind areas.
