"Laser Eye Surgery: Is it Worth Looking Into?" is an article written by Carol Lewis that originally appeared in the July-August 1998 issue of "FDA Consumer," a magazine published by the U.S. Food and Drug Administration (FDA). Lewis notes that the FDA first approved the excimer laser in October 1995 for correcting mild to moderate nearsightedness. She highlights the procedures of photorefractive keratectomy (PRK) and laser in situ Keratomileusis (LASIK). A FAQ about laser eye surgery is available. The FDA presents the article online.

What actually happens to you when you undergo laser eye surgery? What does it feel like? What can you see? The nitty gritty of laser eye surgery is treated with the same taboo as the nitty gritty of giving birth - basically, no one will tell you!

The general assumption is that 'you don't want to know' - but I wanted to know and I can't be alone! The closest I got to an introduction to the real business of giving birth was from a friend who whispered in my ear "It hurts like \*%&@ but you soon forget." She was right, but I would have appreciated a bit more info. The same goes for laser eye surgery. At the age of 48, I had finally decided to have 'blended' lasik laser eye surgery. My dominant eye now sees long distance and the other eye sees close up. My brain has learned to deal with this and the result is very satisfactory. I went in to surgery 'blind' (pun intended). I had very little idea of what to expect, despite my efforts to find out. So, for those of you considering lasik laser eye surgery, who would appreciate a little more nitty gritty info, here it is. I have written a completely non-technical account of my whole experience: the events leading up to my decision to have the surgery, my personal experience in the operating theatre and my recovery notes, triumphs, warts an' all. If you are thinking of having laser eye surgery, this book will give you a really good idea of what you might expect to happen in the theatre - it is what happened to me, what it felt like and what I saw.

Refractive error (ametropia) is a common condition resulting in decreased visual acuity. Patients are treated and symptoms can be corrected with eyeglasses, contact lenses, or surgery. Eyeglasses are the simplest and safest means of refractive error correction. Laser eye surgeries are a subset of surgical procedures used to correct most common refractive errors and are the most frequently performed procedures for low to moderate near-sightedness (myopia). Photorefractive keratectomy (PRK), was developed over 20 years ago, and subsequently wavefront-guided laser in situ keratomileusis (LASIK) has become the most commonly performed keratorefractive procedure. Other procedures are variations of PRK and include laser epithelial keratomileusis (LASEK) and epi-LASIK. Long term studies demonstrate excellent safety, efficacy, and stability of these procedures with long term refractive stability for far-sighted (hyperopic) patients less certain than for myopic patients. Some concern remains regarding the stability of post-surgical refractive error which is reflected in post-surgical waiting periods for refractive surgery patients applying for some occupations with visual acuity requirements in Canada. This report aims to retrieve and review the clinical effectiveness evidence for laser eye surgery as compared to eyeglasses and no treatment for patients with new vision correction requirements and those with unstable visual acuity requiring a change to current refractive correction. Additionally, this report aims to retrieve and review evidence-based guidelines associated with laser eye surgery for first responders and patients with occupational requirements for high visual acuity.

Laser eye surgery is more popular than ever. Clinics are springing up everywhere. Some travel, especially to Turkey, for a cheap treatment. But the world of laser eye surgery is a jumble of slick brochures, fake websites, bankrupt hospitals and old lasers. All about laser eye surgery is written specifically to bring order to this chaos. This book is not a medical textbook. It is a great tool for anyone who is interested in having laser eye surgery! Pierre Saraber wears contact lenses. He noticed that there was hardly any reliable information about laser eye surgery, and so he decided to write this book. He has visited countless exotic countries. After the revolution, he had his own business in Romania. All about laser eye surgery is his first book.

Nearly 3.6 million Americans have their vision surgically corrected annually; it is the most commonly performed surgery in the nation. Even so, many people find themselves feeling anxious about the procedure. Author Robert K. Maloney is an experienced ophthalmologist who has performed thousands of vision correction surgeries. Not only is he an expert at performing these surgeries, he is a compassionate physician who understands the kinds of questions and concerns people have. In this book he covers LASIK and PRK surgeries, the differences between RLE and ICL, the implantable contact lens, refractive lens exchanges, how to choose a surgeon, and the newest vision correction surgery techniques.
