In this paper we study a class of self-consistent dynamical systems, self-consistent in the sense that the discrete time dynamics is different in each step depending on current statistics. The general framework admits popular examples such as coupled map systems. Motivated by an example of [xref ref-type="bibr" rid="b9">9</xref>], we concentrate on a special case where the dynamics in each ...

The aim of this book is to teach topics in economic dynamics such as simulation, stability theory, and dynamic programming. The focus is primarily on stochastic systems in discrete time. Most of the models we meet will be nonlinear, and the emphasis is on getting to grips with nonlinear systems in their original form, rather than using

Discrete time is often employed when empirical measurements are involved, because normally it is only possible to measure variables sequentially. For example, while economic activity actually occurs continuously, there being no moment when the economy is totally in a pause, it is only possible to measure economic activity discretely.
