### Textbook: Biology the Dynamics of Life by Glencoe

Adult individuals are diploid, each individual inheriting chromosomes from two parents. A diploid reproductive cell undergoes meiosis to produce gametes. The gametes (sperm and egg) join in the process fertilization, which results in a diploid zygote. After fertilization, the resulting zygote begins to divide by mitosis.

### Chapter 7 Holt Biology Flashcards | Quizlet

Sexual reproduction involves two parents. As you can see from Figure below, in sexual reproduction, parents produce reproductive cells—called gametes—that unite to form an offspring. Gametes are haploid cells. This means they contain only half the number of chromosomes found in other cells of the organism.

### 2.36: Asexual vs. Sexual Reproduction - Biology LibreTexts

A female's reproductive cycle is controlled by hormones released by the hypothalamus, the pituitary gland, and the ovaries. Each month, the levels of these hormones rise and fall in well-timed feedback loops that regulate the development and release of an egg and prepare the uterus to receive it.
