In mathematics, a partial differential equation is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic

The chapter considers four techniques of solving partial differential equations: separation of variables, the Fourier transform, the Laplace transform, and Green's functions. The chapter solves each of these equations in Cartesian coordinates by separation of variables. The chapter considers the case of Laplace's equation in two variables.
