Molecules of Emotion is not exactly what it claims to be. Dr. Pert describes the book as a description of her research that discovered the scientific link that proves that emotions are modulated by chemicals within the body, thereby bridging the gap between mind and body.

### Molecules of Emotion: The Science Behind Mind-Body ...

The first component of the molecules of emotion is a molecule found on the surface of cells in body and brain called the opiate receptor. It was my discovery of the opiate receptor that launched my career as a bench scientist in the early 1970s, when I found a way to measure it and thereby prove its existence.

Receptors and ligands are the first components of the molecules of emotion. Ligand comes from the Latin ligare meaning "that which binds". It is often used to describe any natural or manmade

substance that binds selectively to its own specific receptor on the surface of a cell.

Dr. Candace Pert (1946-2013) was an internationally recognized neuroscientist and pharmacologist who published over 250 research articles. She was a significant contributor to the emergence of Mind-Body Medicine as an area of legitimate scientific research in the 1980's, earning her the title of "The Mother of Psychoneuroimmunology", and "The Goddess of Neuroscience" by her many [...]

—If receptors are the first components of the molecules of emotion, then ligands are the second. The word ligand comes from the Latin ligare, 'that which binds', sharing its origin with the word religion. Ligand is the term used for any natural or manmade substance that binds selectively to its own specific receptor on the surface of a cell.

Heroin or morphine molecules fit into opiate receptors much as a key fits into the ignition switch of a car—thus turning on the engine of the cell. Snyder and his students were able to show that nerve cells which possess opiate receptors are found in precisely those parts of the brain that control emotion and pain.

What exactly is a molecule of emotion? The first component is the one Pert discovered thirty some years ago that launched her scientific career—the complex molecule known as the receptor, and more specifically—the opiate receptor. She developed a method to measure it and therefore, in a backwards sort of way, prove its existence.

The main theory is that emotional state is caused by a variety of chemicals, particularly peptides. These molecules not only have an influence on your emotions but on your overall physical health as well, you can't really separate the two. I think this theory was groundbreaking at the time, but much more widely accepted now.
